

Your \$400K Coffee Shop Is Probably Paying ~\$16,000/Year in Card Fees

Turn a slice of those fees into about \$20,000 in extra business value over 5 years

If your shop does around **\$400,000 in annual revenue** and nets about **\$100,000 in profit**, you're likely sending roughly **\$16,000 every year** to card companies in processing fees.

That's **\$80,000 over five years** — a private tax on your coffee shop, leaving your business before you pay rent, staff, or yourself.

Square's Bitcoin Payments feature lets you route a **small percentage of sales over a cheaper payment rail** so you:

- Pay less in fees
- Give customers one more way to pay
- Have the option to build long-term upside

Two numbers every coffee shop owner should know

- **≈ \$16,000/year** in card fees on \$400K revenue (that's \$80,000 over 5 years)
- **≈ \$20,000 more total business value over 5 years** if even a small percentage of customers pay with Bitcoin using Square
- You're not "investing" extra cash. You're simply deciding what to do with the 1–4% of sales that already move through your point of sale.

Quick answers you're already thinking about

"Is this some crypto scheme?"

No — it's just another payment rail inside the Square system you already use. No new bank, no new contracts, no crypto exchange account.

"Do I have to hold Bitcoin?"

No — you can set every Bitcoin payment to auto-convert 100% to dollars. You'd only see USD in your bank account.

"What about taxes?"

When you convert to dollars, those sales are treated as ordinary business income — just like card or cash. Square provides downloadable transaction reports and standard tax forms; your accountant will know exactly what to do with them.

How Square's Bitcoin Payments Actually Work

You keep using Square the way you already do

- Same **terminal, iPad, and staff flow**
- At checkout, customers just see an **additional payment option**

Your baristas don't have to become "Bitcoin people." They just tap the Bitcoin option when a customer asks to pay that way.

What's different from card payments

- **0% fees** on Bitcoin payments through 2026, then **1% after** (vs. 2.6%+ on cards)
- Payments route over the **Bitcoin Lightning Network** instead of card networks
- You decide what happens after: **convert instantly to dollars** or **keep some in Bitcoin**

Three simple ways to use this

1. "Just lower my fees"

Turn on Bitcoin payments and **auto-convert 100% to USD**. Customers pay with Bitcoin; you only see dollars.

2. "Give me some upside"

Keep a **small slice (10–25%)** in Bitcoin, convert the rest. Adjust over time as you get comfortable.

Is this actually a fit for your coffee shop?

You're probably a good fit if you:

- Already **use Square** as your point-of-sale
- Are paying **five figures in card fees** every year
- Are open to trying a **new payment option** without changing your whole setup
